Project Vision

In this project we chose to focus on ''open source code''. We want to integrate in the developer's community of Wikipedia, learn and better ourselves from experienced developers.

Goal:

1. Create plugin to Hebrew-Wikipedia website that allowing the users to follow after their reading progress under different categories. This plugin provides quality and controlled learning in Wikipedia

2. Integrating in Wikipedia community.

3. Learn and specialize in web development

Currently there are UserScripts in Wikipedia that allows to manage the 'watchlist', like ''customWatchlist'' that allows to manage the pages in 'watchlist' and organize them under different categories. Also exist userScripts that help to manage the user history in Wikipedia, like HistoryView that allows changing the history view and make it easier to see what pages already been read. Although this userScripts help to manage the progress, they are not provide efficient tool to manage and see the progress under Wikipedia categories.

Elevator Statement

The "Wikipedia" site take big place in the virtual library of every user in the network environment. Every Wikipedia user experienced inefficient learning, and lack of tools to manage the progress. The plugin we will create is a tool that allow measuring the progress under any category in efficient way.
